SkillBridge

Resume and job match report

Text similarity measures document similarity. It is not a hiring probability or ATS score.

This report contains document excerpts; review before sharing. Unsupported PDF font characters appear as '?'. JSON and Markdown preserve original text.

Engine: TF-IDF (unigrams + bigrams)

Text similarity: 9.3 / 100

Detected skill coverage: 44.4%

At a glance

Needs review

Mandatory checks: Needs review

Matched skills: 4 of 9

Matched: Git, Pandas, Python, SQL

Missing required skill evidence: Data Visualization, Excel, Statistics

Missing JD settings: minimum experience, accepted qualifications

Missing resume details: Work experience, Graduation / pass-out year

Your next three actions

1. Complete JD settings: minimum experience, accepted qualifications.

2. Add or correct truthful resume details: Work experience, Graduation / pass-out year.

3. Review required skill evidence first: Data Visualization, Excel, Statistics. Correct omissions or begin the practice plan.

Skill coverage counts positive resume mentions of detected JD skills. Text similarity compares wording or meaning across the documents. They measure different things and can differ greatly; neither is a hiring probability or verified proficiency.

This is a document comparison, not a final job-eligibility decision. No skill-percentage acceptance threshold is configured.

Analysis uses the supplied document text without preview corrections.

Mandatory resume details

Needs review

Mandatory detail checks use resume statements and explicit JD settings. Missing or unclear details cannot pass. These checks do not verify credentials, relevant experience, degree equivalence or final job eligibility.

Work experience: missing

JD setting: Set the JD minimum (0 if freshers are allowed)

Resume: Not found

Evidence: Not found

Confirm the JD minimum and add truthful total work experience or employment dates. A missing statement is not treated as zero.

Qualification: review

JD setting: Set the accepted qualification(s) from the JD

Resume: B.Tech

Evidence: B.Tech in Artificial Intelligence.

State the completed qualification clearly. List each JD-accepted alternative; equivalence and subject requirements must be checked against the evidence.

Graduation / pass-out year: missing

JD setting: A graduation year must be stated; no JD batch restriction configured

Resume: Not found beside a qualification

Evidence: Not found

Add the pass-out year beside the relevant qualification. Expected completion is flagged for review; birth and employment years are not graduation evidence.

Experience method: No usable total

Add an explicit total such as 'Work experience: 2 years', or month/year employment dates. Freshers can state 'Work experience: 0 years'.

Requirement priorities

Required - coverage: 50.0%

Detected: Data Visualization, Excel, Pandas, Python, SQL, Statistics

To review: Data Visualization, Excel, Statistics

Preferred - coverage: 33.3%

Detected: Communication, Git, Power BI

To review: Communication, Power BI

Unspecified - coverage: N/A

Detected: None

To review: None

Skills overview

Positive evidence in both: Git, Pandas, Python, SQL

Without positive resume evidence: Communication, Data Visualization, Excel, Power BI, Statistics

Other resume skills: CSS, Data Analysis, HTML, JavaScript, Machine Learning, NumPy, REST APIs, scikit-learn

Suggested next steps

Required skills to review first: Data Visualization, Excel, Statistics.

Review skills without positive resume evidence. Prioritize required skills, then unspecified and preferred skills. Add claims only if you can demonstrate them.

For each matched skill, add a specific project example and a measurable result, if you have one.

Keep headings clear: Summary, Skills, Projects, Experience and Education.

Practice plan

Data Visualization - required / resume: not found

Goal: Check whether you already have truthful evidence; otherwise start with a small exercise.

Practice: Create a bar chart and a trend chart with clear units, labels and a written takeaway.

Check: Check plotted values against the dataset and explain why each chart fits the question.

Proof: Save the exercise, checks and a short explanation in your portfolio. Add a resume claim only after you can demonstrate it.

Matplotlib tutorials: https://matplotlib.org/stable/tutorials/index.html

Excel - required / resume: not found

Goal: Check whether you already have truthful evidence; otherwise start with a small exercise.

Practice: Create a budget workbook with formulas, a pivot table and a chart.

Check: Reconcile totals manually and test blank cells and new rows.

Proof: Save the exercise, checks and a short explanation in your portfolio. Add a resume claim only after you can demonstrate it.

Microsoft Excel help and learning: https://support.microsoft.com/en-us/excel/

Statistics - required / resume: not found

Goal: Check whether you already have truthful evidence; otherwise start with a small exercise.

Practice: Use a small dataset to calculate mean, median, spread and a confidence interval; explain the assumptions.

Check: Check calculations on a hand-worked example and describe uncertainty without claiming causation.

Proof: Save the exercise, checks and a short explanation in your portfolio. Add a resume claim only after you can demonstrate it.

NIST statistical methods handbook: https://www.itl.nist.gov/div898/handbook/

Communication - preferred / resume: not found

Goal: Check whether you already have truthful evidence; otherwise start with a small exercise.

Practice: Present one project in three minutes: problem, method, result and limitation.

Check: Ask a peer to summarize your conclusion and revise anything unclear.

Proof: Save the exercise, checks and a short explanation in your portfolio. Add a resume claim only after you can demonstrate it.

British Council speaking practice tips: https://learnenglish.britishcouncil.org/level/improve-your-english-level/how-improve-your-english-speaking

Power BI - preferred / resume: not found

Goal: Check whether you already have truthful evidence; otherwise start with a small exercise.

Practice: Import a sample sales dataset and create a dashboard with measures and filters.

Check: Compare dashboard totals with the source data and test each filter.

Proof: Save the exercise, checks and a short explanation in your portfolio. Add a resume claim only after you can demonstrate it.

Microsoft Learn for Power BI: https://learn.microsoft.com/en-us/training/powerplatform/power-bi

Skill evidence

Communication - preferred / resume: not found

Resume: Not found

Job: Preferred skills: Power BI, Git and Communication.

Data Visualization - required / resume: not found

Resume: Not found

Job: Required skills: Python, SQL, Pandas, Excel, Data Visualization and Statistics.

Excel - required / resume: not found

Resume: Not found

Job: Required skills: Python, SQL, Pandas, Excel, Data Visualization and Statistics.

Git - preferred / resume: mentioned

Resume: Python, SQL, Pandas, NumPy, scikit-learn, Machine Learning, Git, HTML, CSS, JavaScript.

Job: Preferred skills: Power BI, Git and Communication.

Pandas - required / resume: mentioned

Resume: Python, SQL, Pandas, NumPy, scikit-learn, Machine Learning, Git, HTML, CSS, JavaScript.

Job: Required skills: Python, SQL, Pandas, Excel, Data Visualization and Statistics.

Power BI - preferred / resume: not found

Resume: Not found

Job: Preferred skills: Power BI, Git and Communication.

Python - required / resume: mentioned

Resume: Python, SQL, Pandas, NumPy, scikit-learn, Machine Learning, Git, HTML, CSS, JavaScript.

Job: Required skills: Python, SQL, Pandas, Excel, Data Visualization and Statistics.

SQL - required / resume: mentioned

Resume: Python, SQL, Pandas, NumPy, scikit-learn, Machine Learning, Git, HTML, CSS, JavaScript.

Job: Required skills: Python, SQL, Pandas, Excel, Data Visualization and Statistics.

Statistics - required / resume: not found

Resume: Not found

Job: Required skills: Python, SQL, Pandas, Excel, Data Visualization and Statistics.

Resume mentions needing context review

No learning, negative or conflicting mentions detected.

Job skills explicitly not required

None detected.

Daily study plan

Requested: 14 days. Scheduled: 15 days. Budget: up to 60 minutes/day.

Completed days: 0. Each session: 10 minutes learn, 15 minutes practice, 5 minutes review.

Daily self-check: save your result and explain the steps without copying. Repeat or extend the exercise if needed.

A starter roadmap, not a complete syllabus or a promise of job readiness. Beginner covers foundations; Intermediate skips the first two introductory topics; Advanced focuses on a project and review. Check prerequisites before skipping topics. Each session budgets 10 minutes learning, 15 practice and 5 review. Save a progress backup and restore it in a later session to continue. Quizzes are formative practice, not verified proficiency; completing a plan does not change match scores. Search links are unreviewed results.

The schedule was extended to include every starter topic within your daily budget.

Day 1 - 60 minutes / to do

Data Visualization / Choose an appropriate chart (required; curated starter topics)

Practice: Match three questions to bar, line or scatter charts.

Level: Beginner | Prerequisite: Basic tables, categories and numeric data

Lesson: Use bars for category comparisons, lines for ordered time trends and scatter plots for relationships between two numeric variables. Match the chart to the question.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain choose an appropriate chart using your own Data Visualization example. What could go wrong?

Data Visualization / Labels, units and axes (required; curated starter topics)

Practice: Plot a small dataset with a title, labels and readable scales.

Level: Beginner | Prerequisite: Basic tables, categories and numeric data

Lesson: Label axes with units, identify the time period and explain transformed scales. A bar chart usually needs a zero baseline for honest length comparisons.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain labels, units and axes using your own Data Visualization example. What could go wrong?

Day 2 - 60 minutes / to do

Data Visualization / Comparison and trends (required; curated starter topics)

Practice: Create a bar and line chart and write one supported takeaway for each.

Level: Beginner | Prerequisite: Basic tables, categories and numeric data

Lesson: Compare like-for-like periods and denominators. A visible pattern does not establish its cause; write a takeaway that the data actually supports.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain comparison and trends using your own Data Visualization example. What could go wrong?

Data Visualization / Accessible and honest presentation (required; curated starter topics)

Practice: Remove clutter and check color contrast, units and misleading scales.

Level: Beginner | Prerequisite: Basic tables, categories and numeric data

Lesson: Use labels or shapes as well as color. Remove decorative clutter, make text readable and disclose missing data and important uncertainty.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain accessible and honest presentation using your own Data Visualization example. What could go wrong?

Day 3 - 60 minutes / to do

Data Visualization / Mini-project (required; curated starter topics)

Practice: Create a bar chart and a trend chart with clear units, labels and a written takeaway.

Level: Beginner | Prerequisite: Basic tables, categories and numeric data

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain mini-project using your own Data Visualization example. What could go wrong?

Quiz: Which chart best shows a trend over ordered dates?

1. An unlabeled pie chart | 2. A line chart | 3. A decorative icon

Answer: A line chart. A line chart connects observations in temporal order.

Data Visualization / Review and self-check (required; curated starter topics)

Practice: Check plotted values against the dataset and explain why each chart fits the question.

Level: Beginner | Prerequisite: Basic tables, categories and numeric data

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain review and self-check using your own Data Visualization example. What could go wrong?

Quiz: Which chart best shows a trend over ordered dates?

1. An unlabeled pie chart | 2. A line chart | 3. A decorative icon

Answer: A line chart. A line chart connects observations in temporal order.

Day 4 - 60 minutes / to do

Excel / Cells, tables and data types (required; curated starter topics)

Practice: Create a 15-row expense table with clear column headings.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Keep one observation per row and one field per column. Store numbers as numbers and dates consistently; merged cells make analysis harder.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain cells, tables and data types using your own Excel example. What could go wrong?

Excel / Formulas and references (required; curated starter topics)

Practice: Use SUM, AVERAGE and IF; test relative and absolute references.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Relative references move when a formula is copied. Dollar signs lock a row or column, so A1 stays fixed. Test copied formulas at the bottom of a table.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain formulas and references using your own Excel example. What could go wrong?

Day 5 - 60 minutes / to do

Excel / Sorting, filtering and cleaning (required; curated starter topics)

Practice: Filter the table and correct blanks and inconsistent labels.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Filtering hides rows; it does not delete them. Preserve a raw copy before cleaning, and record how blanks and duplicate entries were handled.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain sorting, filtering and cleaning using your own Excel example. What could go wrong?

Excel / Pivot tables and charts (required; curated starter topics)

Practice: Create a category summary and a chart with clear units.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: A pivot table groups records and summarizes values. Confirm SUM versus COUNT, refresh after source changes, and label chart units.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain pivot tables and charts using your own Excel example. What could go wrong?

Day 6 - 60 minutes / to do

Excel / Mini-project (required; curated starter topics)

Practice: Create a budget workbook with formulas, a pivot table and a chart.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain mini-project using your own Excel example. What could go wrong?

Quiz: Which reference keeps both row and column fixed when copied?

1. A1 | 2. A1 | 3. A$1

Answer: A1. $ before the column and row locks both parts.

Excel / Review and self-check (required; curated starter topics)

Practice: Reconcile totals manually and test blank cells and new rows.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain review and self-check using your own Excel example. What could go wrong?

Quiz: Which reference keeps both row and column fixed when copied?

1. A1 | 2. A1 | 3. A$1

Answer: A1. $ before the column and row locks both parts.

Day 7 - 60 minutes / to do

Statistics / Mean, median and spread (required; curated starter topics)

Practice: Calculate summary statistics on ten values and check them by hand.

Level: Beginner | Prerequisite: Arithmetic, percentages and basic algebra

Lesson: The mean uses every value; the median is the middle ordered value. Outliers affect the mean more strongly. Report spread as well as a center.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain mean, median and spread using your own Statistics example. What could go wrong?

Statistics / Distributions and sampling (required; curated starter topics)

Practice: Plot a small distribution and explain sample versus population.

Level: Beginner | Prerequisite: Arithmetic, percentages and basic algebra

Lesson: A sample is a subset of a population. Sampling method affects representativeness; a large biased sample may still mislead.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain distributions and sampling using your own Statistics example. What could go wrong?

Day 8 - 60 minutes / to do

Statistics / Correlation and uncertainty (required; curated starter topics)

Practice: Compare two variables and explain why correlation does not establish causation.

Level: Beginner | Prerequisite: Arithmetic, percentages and basic algebra

Lesson: Correlation describes association, not causation. Confounders and reverse causality can explain a relationship; inspect uncertainty and data collection.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain correlation and uncertainty using your own Statistics example. What could go wrong?

Statistics / Confidence intervals and hypotheses (required; curated starter topics)

Practice: Explain a confidence interval and a null hypothesis using a simple worked example.

Level: Beginner | Prerequisite: Arithmetic, percentages and basic algebra

Lesson: A frequentist 95% confidence procedure covers the fixed population parameter in 95% of repeated samples under its assumptions. A p-value is not the probability that the null hypothesis is true.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain confidence intervals and hypotheses using your own Statistics example. What could go wrong?

Day 9 - 60 minutes / to do

Statistics / Mini-project (required; curated starter topics)

Practice: Use a small dataset to calculate mean, median, spread and a confidence interval; explain the assumptions.

Level: Beginner | Prerequisite: Arithmetic, percentages and basic algebra

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain mini-project using your own Statistics example. What could go wrong?

Quiz: Does a correlation alone establish causation?

1. No; confounding or reverse causality may explain it | 2. Yes, if it is positive | 3. Yes, if the chart looks clear

Answer: No; confounding or reverse causality may explain it. Association alone does not identify a causal mechanism.

Statistics / Review and self-check (required; curated starter topics)

Practice: Check calculations on a hand-worked example and describe uncertainty without claiming causation.

Level: Beginner | Prerequisite: Arithmetic, percentages and basic algebra

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain review and self-check using your own Statistics example. What could go wrong?

Quiz: Does a correlation alone establish causation?

1. No; confounding or reverse causality may explain it | 2. Yes, if it is positive | 3. Yes, if the chart looks clear

Answer: No; confounding or reverse causality may explain it. Association alone does not identify a causal mechanism.

Day 10 - 60 minutes / to do

Communication / Audience and main message (preferred; curated starter topics)

Practice: Write one clear takeaway about a project for a nontechnical audience.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Identify the audience, the decision they need to make and one main takeaway. Explain necessary terms in language suited to that audience.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain audience and main message using your own Communication example. What could go wrong?

Communication / Structure and concise writing (preferred; curated starter topics)

Practice: Write a five-sentence problem-method-result-limitation summary.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Organize a project explanation around problem, method, result and limitation. Put the main point first and remove claims unsupported by evidence.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain structure and concise writing using your own Communication example. What could go wrong?

Day 11 - 60 minutes / to do

Communication / Speaking and active listening (preferred; curated starter topics)

Practice: Record a two-minute explanation and summarize a peer's feedback.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Listen without planning a rebuttal. Restate the other person’s meaning and check your understanding before responding.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain speaking and active listening using your own Communication example. What could go wrong?

Communication / Questions and feedback (preferred; curated starter topics)

Practice: Answer three likely project questions and revise an unclear explanation.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Answer the question directly, give evidence and state uncertainty. Use feedback to revise the explanation and confirm that the revision helped.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain questions and feedback using your own Communication example. What could go wrong?

Day 12 - 60 minutes / to do

Communication / Mini-project (preferred; curated starter topics)

Practice: Present one project in three minutes: problem, method, result and limitation.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain mini-project using your own Communication example. What could go wrong?

Quiz: How should you check that you understood a colleague?

1. Interrupt immediately | 2. Assume their intent | 3. Paraphrase and ask for confirmation

Answer: Paraphrase and ask for confirmation. Paraphrasing makes misunderstandings visible.

Communication / Review and self-check (preferred; curated starter topics)

Practice: Ask a peer to summarize your conclusion and revise anything unclear.

Level: Beginner | Prerequisite: Basic familiarity with the topic and a suitable practice tool

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain review and self-check using your own Communication example. What could go wrong?

Quiz: How should you check that you understood a colleague?

1. Interrupt immediately | 2. Assume their intent | 3. Paraphrase and ask for confirmation

Answer: Paraphrase and ask for confirmation. Paraphrasing makes misunderstandings visible.

Day 13 - 60 minutes / to do

Power BI / Import data and Power Query (preferred; curated starter topics)

Practice: Import a sample CSV and correct types and missing values.

Level: Beginner | Prerequisite: Tabular data, column types and basic aggregation

Lesson: Power Query records transformations. Set correct types and inspect errors before loading; a number formatted as text can break an aggregation.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain import data and power query using your own Power BI example. What could go wrong?

Power BI / Relationships and data model (preferred; curated starter topics)

Practice: Relate two small tables and explain the join keys.

Level: Beginner | Prerequisite: Tabular data, column types and basic aggregation

Lesson: Relationships propagate filters between tables. Understand key uniqueness, cardinality and filter direction before comparing totals.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain relationships and data model using your own Power BI example. What could go wrong?

Day 14 - 60 minutes / to do

Power BI / Measures and basic DAX (preferred; curated starter topics)

Practice: Create a total-sales measure and check it against the source.

Level: Beginner | Prerequisite: Tabular data, column types and basic aggregation

Lesson: A measure is evaluated in filter context. A calculated column is computed per row during refresh. Test a measure with and without slicers.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain measures and basic dax using your own Power BI example. What could go wrong?

Power BI / Visuals, slicers and interactions (preferred; curated starter topics)

Practice: Build a report page and test how its filters affect every visual.

Level: Beginner | Prerequisite: Tabular data, column types and basic aggregation

Lesson: A slicer changes filter context. Visual interactions may filter or highlight other visuals; test each interaction and include clear titles and units.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain visuals, slicers and interactions using your own Power BI example. What could go wrong?

Day 15 - 60 minutes / to do

Power BI / Mini-project (preferred; curated starter topics)

Practice: Import a sample sales dataset and create a dashboard with measures and filters.

Level: Beginner | Prerequisite: Tabular data, column types and basic aggregation

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain mini-project using your own Power BI example. What could go wrong?

Quiz: What can change a measure result interactively?

1. Renaming the report file | 2. Moving a title | 3. Changing filter context with a slicer

Answer: Changing filter context with a slicer. Measures are evaluated under the current filter context.

Power BI / Review and self-check (preferred; curated starter topics)

Practice: Compare dashboard totals with the source data and test each filter.

Level: Beginner | Prerequisite: Tabular data, column types and basic aggregation

Lesson: Apply the earlier concepts independently. Define expected results, test an edge case, and explain one limitation of your solution.

Challenge: Follow one example, then recreate it without copying.

Self-check: Explain review and self-check using your own Power BI example. What could go wrong?

Quiz: What can change a measure result interactively?

1. Renaming the report file | 2. Moving a title | 3. Changing filter context with a slicer

Answer: Changing filter context with a slicer. Measures are evaluated under the current filter context.

Limitations and privacy

Similarity is not a hiring probability, an ATS score or a measure of candidate quality.

Skills are dictionary-based mentions, not verified proficiency. English context rules can miss negation, complex lists and unusual phrasing; review evidence.

Learning, negated and conflicting mentions do not count as positive skill evidence. Positive mentions do not prove proficiency.

Required/preferred labels are inferred from explicit cues and headings. Unmarked skills remain unspecified. All-skill coverage is unweighted; category coverage is separate.

Experience, qualification and graduation checks compare resume statements with configured requirements; they do not verify credentials or final eligibility. Curated practice tasks are templates.

No readable evidence does not mean the candidate lacks the skill. English text works best.

Names, contact details and unrelated content can influence whole-document text similarity.
